

Location:
Leiden, The Netherlands

Building area:
26 square meters

Building Type:
Visitor Centres

Status:
Shortlisted Young Architecture Award

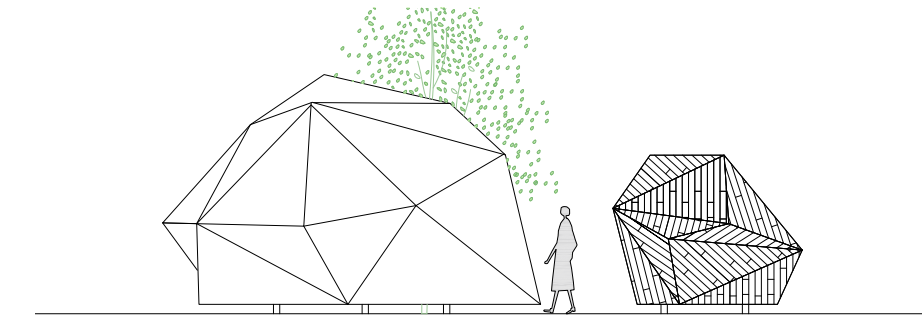

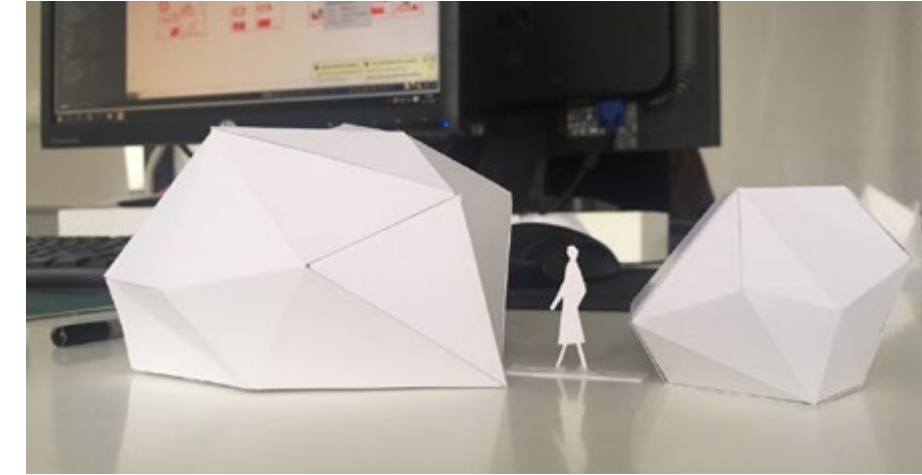

Main Work includes:
Individual work. Concept design, Photoshop, 3D Model in Rhino and Grashopper, 2D Drawing in Autocad, Rendering in Vray, Physical Paper model, Diagram in Illustrator, Detailing research.

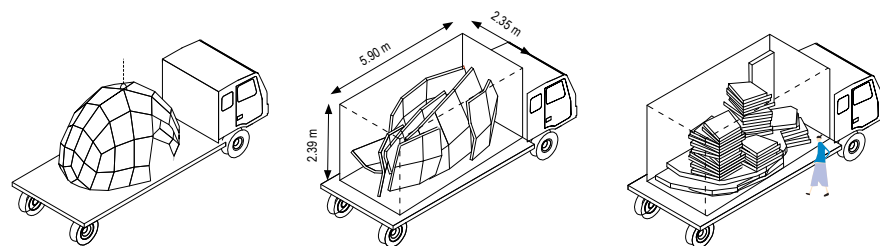

The site is located in the Wassenaar, it is famous for its beautiful forest and dune landscape near the sea. The competition was about a moveable visitor center for two locations with different natural atmosphere, on in the forest and the other in the dune. So the design started with the concerns about searching ideas that fits for two atmosphere at one time.

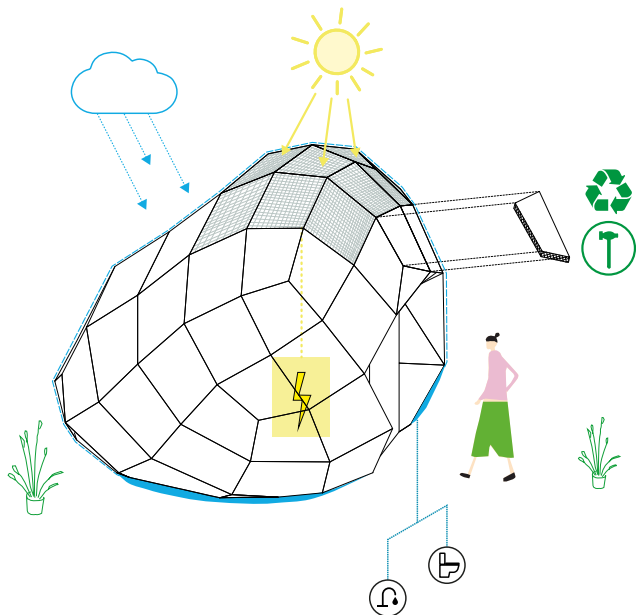

Under the inspirations from Kengo Kuma. The idea starts to put buildings back in harmony with nature and no longer to dominate it. So It was designed as a stone-like volumes, which seems naturally blends in the landscape. However, the reflective skin is clearly recognizable as human additions which is quite outstanding for a visitor center.

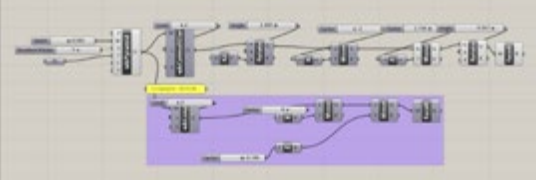

The climate-spending main volume is completely self-sufficient, with transparent solar cells(reference: Rotterdam train station) and water collection. The volumes can be moved in whole or in parts by truck. It is also possible to completely deconstruct them for long-term (compact) storage.

In order to put the buildings back in harmony with the surrounding. The volume is divided into three pieces so it is less dominated the surrounding. It is divided according to public functions or the internal use. So it includes a bigger volume for the ticket center and a smaller shelter for the workers in the forest. To elaborate the natural objects further, I chose a reflective skin, it melts together in a camouflage-like way with the environment. At the same time, it forms the same skin by refraction and reflection a new composition of the surrounding landscape. It is a visual reinterpretation of the existing natural and cultural landscape.
